

Height and weight for females with Down syndrome, 2 to 18 years of age, based on mixed longitudinal data of approximately 300 girls with Down syndrome born between 1960 and 1986 and reared at home. Children with congenital heart disease are included in the sample. Data collected at the Developmental Evaluation Clinic of the Children's Hospital Boston, The Child Development Center of Rhode Island Hospital and the Clinical Genetics Service of the Children's Hospital of Philadelphia.
